

Washing baskets

We protect your components

Cleaning sensitive components is playing an increasingly important role.

Here the focus is on a damage-free handling of the components within the production and during the cleaning process.

Steels cause marks on the components and will not resist the chemical attack over time due to the chemistry used in the cleaning process.

Plastics become brittle and break due to thermal cycling in combination with the use of cleaning agents.

All of this leads to increasing reject rates, high costs, new production and supply shortages.

With our surfaces

- **M-Line ultra⁺ PA** (biocompatible surface) and
- **ETFE ultra⁺** (FDA- and EU-conformal)

we can offer you solutions that protect your components against damage and can withstand the chemical and thermal stress during the cleaning process without losing their properties.

Anti-adhesive properties of the surface, sterilisability, shock and impact resistance complete the picture of the unique properties of our surfaces.

If you should have ever caused a minor damage to the surface due to improper handling, also repairing of the defective spot is feasible.

Our surfaces ensure your trouble-free production process.

We look forward to receiving your inquiries/requests.
